The method involves the identification of peptide sequences capable of binding to an HLA (human leukcyte antigen) class I molecule and measuring the binding of this epitide to the HLA class I histocompatablily complex) class I molecule is measured on intact histocompatablily complex) class I molecule is measured on intact histocompatablily complex) class I molecule is measured on intact histocompatablily complex of peptide at their cell surfaces. The method can be used to select peptide epitopes for generating vaccines against a disease associated with the polypeptide, e.g. cancers or AIDS. The peptide epitopes are especially T-cell peptide epitopes with strong anti-tumour and anti-viral immune responses. Peptide AAW39445 is the HCVIcore-131 peptide which is a HLA-A*0201 restricted cytotoxic T
from the core, El, E2/NS1, NS2, NS3, NS4 or NS5 regions. The peptides were tested for peptide specific cytotoxic T-cell activity. The peptides AR884570-77 were found to have substantial homology with a T-cell epitope and are useful in vaccines against HCV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      T cell epitope; immune response; human leukocyte antigen; HLA Class I; vaccine; immunogenic; major histocompatablilty complex; MHC; B cell; disease; anti-tumour; anti-viral.

The present invention describes a method of inducing and/or sustaining an immunological cytotoxic T lymphocyte (CTL) response in a mammal. The method comprises: (a) delivering an antigen to the mammal at a level to induce an immunological CTL response in the mammal; and (b) maintaining the level of the antigen in the mammal's lymphatic system to maintaining the immunologic CTL response. The method can be used for the delivery of e.g. a differentiation antigen, a tumour-specific multilineage antigen, an embryonic antigen, an encogene antigen, a mutated tumour-suppressor gene antigen, or a viral antigen. They can be used for the treatment of disease such as cancer, e.g. malignant melanoma or infectious disease, e.g. viral disease such as hepatitis or AIDS. Sustained antigen delivery to the lymphatic system provides for potent CTL stimulation that takes that is necessary to keep CTL active, cytotoxic and recirculation that the body. AAY10071 to AAY10639 represent examples of peptide antigens given in the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

lymphocyte (CTL) epitope.

10 AA

Sequence

a

```
The present invention describes a composition comprising a prepared hepatitis C virus (HCV) epitope such as those given in AAJ00010-AAJ04121. These are derived from HCV HLA-binding motifs. They are useful in vaccines for the prevention and treatment of HCV infection in humans. The present sequence is an epitope used in the disclosure of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Helper T-cell peptide; human leucocyte antigen; HLA; DR4w4; DR1; DR7; cytotoxic T lymphocyte; CTL; hepatitis; autoimmune disease; acquired immune deficiency syndrome; malaria; cancer; allograft rejection; allergy; Lyme disease; hepatitis; post-streptococcal endocarditis; glomerulonephritis; food hypersensitivity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Composition containing peptide that induces cytotoxic T lymphocyte response, and helper peptide - can bind to human leucocyte antigen alleles, used to treat or prevent cancers, parasitic infections and autoimmune disease
                                                                                                                                                                                                  A new composition useful as a vaccines against hepatitis C virus

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes a composition comprising a prepared hepatitis C virus (HCV) epitope such as those given in AAJ00010-AAJ04121. These are derived from HCV HLA-binding motifs. They are useful in vaccines for the prevention and treatment of HCV infection in humans. The present sequence is an epitope used in the disclosure of the invention.
                                                                                                                                                                                                              Hepatitis C virus; HCV; epitope; vaccine; immunogen; HLA-binding motif;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Hepatitis C virus; HCV; epitope; vaccine; immunogen; HLA-binding motif;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               A new composition useful as a vaccines against hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

These are derived from HCV HLA-binding motifs. They are useful in vaccines for the prevention and treatment of HCV infection in humans. The present sequence is an epitope used in the disclosure of the invention.
                                        AAW85138-283 represent helper T-cell peptides, which can bind to the human leucocyte antigens (HLA) DR4W4, DR1 and DR7. The peptides are used in the course of the invention. The specification describes peptides that that induce a cytotoxic T lymphocyte (CTL) response, and T-helper peptides, that are used together to generate a CTL response for the treatment or pervention of viral, fungal, bacterial or parastic infections (e.g. hepatitis, acquired immune deficiency syndrome or malaria) or cancer (e.g. renal or cervical carcinoma, lymphoma, prostate cancer or condyloma acuminatum). Helper T-cell peptides may be used alone to induce a helper T cell response, e.g. in cases of autoimmune disease, allograft rejection, allergy, Lyme disease, hepatitis, post-streetics.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes a composition comprising a prepared hepatitis C virus (HCV) epitope such as those given in AAJ00010-AAJ04121. These are derived from HCV HLA-binding motifs. They are useful in vaccines for the prevention and treatment of HCV infection in humans. The present sequence is an epitope used in the disclosure of the invention.
                                                                                                                                                                                                                                                                                                             Hepatitis C virus; HCV; epitope; vaccine; immunogen; HLA-binding motif;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Hepatitis C virus; HCV; epitope; vaccine; immunogen; HLA-binding motif;

The present invention describes a composition comprising a prepared hepatitis C virus (HCV) epitope such as those given in AAJ00010-AAJ04121. These are derived from HCV HLA-binding motifs. They are useful in vaccines for the prevention and treatment of HCV infection in humans. The present sequence is an epitope used in the disclosure of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAR87651-53 are hepatitis C virus (HCV) core region peptides which can be used for the immunisation of an individual against HCV. They can also be used for diagnosing exposure of a patient to HCV or for predicting a patient's clinical course following HCV infection. The peptides provoke the activation of cytotoxic T cells which attack any cell infected with HCV.
                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Hepatitis C virus core peptide(s) stimulate cytotoxic T lymphocyte response - used for prevention, treatment or diagnosis of HCV
                                                                                                                                                                                                                                                                                                                                                      Hepatitis C virus; cytotoxic T lymphocyte; vaccine; immunisation; diagnosis; HCV; CTL; core; HLA.

                                                                                                                                                                                                                                                                                                                                                                                                         ó;
                                                                                                                                                                                                                                                              The present invention describes a composition comprising a prepared hepatitis C virus (HCV) epitope such as those given in AAJ00010-AAJ04121. These are derived from HCV HLA-binding mottlfs. They are useful in vaccines for the prevention and treatment of HCV infection in humans. The present sequence is an epitope used in the disclosure of the invention.

A T-cell stimulating peptide is claimed which is ca. 5-20 amino acids long and part of the core protein of HCV and is recognised by and stimulates T-cells. A CD8-DOSI(ive T-cell stimulating peptide has the sequence given in ARR56606 (NP-9) or AAR56616 (9MA). A CD4-POSI(ive T-cell stimulating peptide has the sequence given in AAR56609 (NP-1). Synthetic peptide mixts. (Mix A: NP-1 - NP-12) or AAR56614 (NP-17). Synthetic peptide mixts. (Mix A: NP-1 - NP-5, Mix B: NP-6 - NP-10, Mix C: NP-11 - NP14, MixD: NP-15 - NP-18) were used in experiments to evaluate activity.

Peptides 9MA, 9CM and 9CA (AAR56616-18) are variants of peptide NP-9.
                                                                                                                                                                                                                                                                                                                                                                                                                      epitope present in the core protein region of Hepatitis C (HCV) - used for activation of cellular immunity mechanisms

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                protein (HSP) complexes comprises adding a heat shock protein to a denatured protein matrix for binding, and adding a complexing solution comprising a peptide to elute a heat shock protein-peptide complex. A HSP-antigen complex is useful as a vaccine for treating an allergic disease (in a mammal, preferably a human) to reduce susceptibility of the Th2 response, the complex compressing a HSP-antigenic peptide complex. The complex is administered to prevent a mammal from having an allergic reaction to an allergic disease, or administered to a mammal having an allergic disease, to reduce the allergic reactions. Allergic diseases include antihistamines which treat only the symptoms, corticosteroids which have severe side effects and desensitization flexibility of use of peptide-based vaccines, as prior art HSP-based vaccines require isolation from a portion of the tumour itself. This sequence represents a peptide fragment from the HCV viral core protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

                                                                                                                                                        A T-cell stimulating peptide is claimed which is ca. 5-20 amino acids long and part of the core protein of HCV and is recognised by and stimulates T-cells. A CD8-DOSITIVE T-cell stimulating peptide has the sequence given in ARR56606 (NP-9) or ARR56616 (9MA). A CD4-DOSITIVE T-cell stimulating peptide has the sequence given in ARR56609 (NP-12) or ARR56614 (NP-17). Synthetic peptide mixts. (Mix A: NP-1 NP-5, Mix B: NP-6 - NP-10, Mix C: NP-11 - ND14, MixD: NP-15 - NP-18) were used in experiments to evaluate activity.

Peptides 9MA, 9CM and 9CA (AARS5616-18) are variants of peptide NP-9.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A series of overlapping peptides (including the present sequence) was synthesised based on sequences in the core, B1 and B2/NB1 regions of hepatitis C virus. The peptides were used as antigens in Tymphopoliferative assays to identify the main T-cell epitopes.
                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Hepatitis C Virus immunogenic polypeptide contg. a T-cell stimulating epitope - from core, El, E2 and NS3 regions, useful in production of vaccines, therapeutic agents, etc.
                                                                          T cell epitope present in the core protein region of Hepatitis C virus (HCV) - used for activation of cellular immunity mechanisms

C. Superfamily: hepatitis C virus genome polyprotein
C. Keywords: ATP: capsid protein; envelope protein; glycoprotein; nonstructural protein
F;192-383/Product: envelope protein EI #status predicted <SPS>
F;384-411/Product: nonstructural protein E2/NS1 #status predicted <NPS>
F;196,209,234,305,325/Binding site: carbohydrate (Asn) (covalent) #status predicted
                                                                                   N; Contains: envelope protein EI; nonstructural protein E2/NS1
C; Species: hepatitis C virus
C; Species: hepatitis C virus
C; Date: 14-Jul-1994 #sequence_revision 14-Jul-1994 #text_change 17-Nov-2000
C; Accession: PC2060

genome polyprotein - hepatitis C virus (isolate JK2) (fragment)
N.Contains: core protein; envelope protein 1; nonstructural protein 2; NS1/E2 protein
C.Species: hepatitis C virus
A.Variety: isolate JK2
C.Date: 30-Jun-1992 #sequence_revision 30-Jun-1992 #text_change 17-Nov-2000
C.Accession: S18031
B.HONDA, M.; Kaneko, S.; Masashi, U.; Kobayashi, K.; Murakami, S.
Submitted to the EMBL Data Library, September 1991
A.Description: Sequence analysis of putative structural regions of Hepatitis C Virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Argherimental source: isolate JR2

Genome polyprotein [Contains: Capsid protein C (Core protein) (P22);
Envelope glycoprotein El (GP32) (GP35); Envelope glycoprotein E2
                                                                                                                                                                                                                                                                                                                                                                              VITOLOGY 188:331-341(1992).

-!- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION. NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
-!- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
                                                                                                     Viruses; ssRNA positive-strand viruses, no DNA stage; Flaviviridae;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CAPSID PROTEIN C (POTENTIAL).

Genomic characterization and mutation rate of hepatitis C virus
isolated from a patient who contracted hepatitis during an epidemic
of non-A, non-B hepatitis in Japan.";
J. Gen. Virol. 73:2725-2739(1992).
-!- SUBGNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A
LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GIFCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF
PROTEIN C AND MRNA.
                                                                                                                                          01-JUL-1993 (Rel. 26, Last sequence update)

Genome polyprotein (Contains Capsid protein C (Core protein) (P22);
Envelope glycoprotein El (GP32) (GP35); Envelope glycoprotein E2
(GP68) (GP70) (N81); Protein P7: Nonstructural protein NS2 (P21)
(EC 3 4.22 -); Protease/helicase NS3 (P70) (Hepacivirin)
(EC 3.4.21-98); Nonstructural protein NSA (P4); Nonstructural protein
NSAB (P27); Nonstructural protein NSA (P45); Nonstructural protein
NSAB (P60) (P70) (RNA-directed RNA pollymerase) (EC 2.7.7.48)].
Hepatitis C virus (isolate HC-JT) (HCV).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              MEDLINE=92295714; PubMed=1318627;

carrier: sequence variation within the same individual and among
infected individuals.";
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   VILLUS RES. 23:39-53(1992).

-! FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE HYDROPHOBILE. SUGGESTING A POSSIBLE MEMBRANE-RELEATED FUNCTION.

NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.

-! CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral position, Cys or Thr in Pl and Ser or Ala in Pl'.

-! SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOROPOFIN BAYELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C. AND MRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SIMILARITY: THE PROTEASE BELONGS TO PEPTIDASE FAMILY S29.

-! FUNCTION: THE SMALL PROFEINS NSZA, NSZB, NSAA AND NSAB ARE HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION: NS3 AND NSS MXY ELMY A ROLE IN THE VIRAL RNA REPLICATION.

-! CARALTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in P1 and Ser or Ala in P1'.

-SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLECCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: PROTEIN M AND GLYCOPROTEIN E. THE NUCLECCAPSID IS A COMPLEX OF PROTEIN C.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Polyprotein; Glycoprotein; Transferase; RNA-directed RNA polymerase; Core protein; Coat protein; Envelope protein; Helicase; ATP-binding;

-!- FUNCTION: NS4A FORMS A COMPLEX WITH NS3 AND IS ESSENTIAL FOR THE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ACTIVATION OF N33.
-!- FUNCTION: NS5A SEEMS TO HAVE A TRANSCRIPTIONAL ACTIVATORY ROLE.
-!- FUNCTION: NS5B IS A RNA-DEPENDENT RNA POLYMERASE THAT PLAYS AN
-!- CATALYTIAL ROLE IN THE VIRONS REPLICATION.
-!- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral
precursor polyprotein, commonly with Asp or Glu in the P6
position, Cys or Thr in P1 and Ser or Ala in P1'.
                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             MEDLINE-98154321; PubMed-9493270;

SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: E1 AND E2. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA. PTM: THE STRUCTURAL PROTEINS C, E1 AND E2 ARE PRODUCED BY PROTEOLYTIC PROCESSING BY THE HOST SIGNAL PEPTIDASES. SIMILARITY: THE NS2 PROTEASE BELONGS TO PEPTIDASE FAMILY C18. SIMILARITY: THE NS3 PROTEASE BELONGS TO PEPTIDASE FAMILY C18.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SIMILARITY).

Genome polyprotein (Contains: Capsid protein C (Core protein); Matrix
protein (Envelope protein M); Major envelope protein E; Nonstructural
proteins NSI and NS2] (Fragment).
Hepatitis C virus (isolate HG-J5) (HCV).
Viruses; ssRNA positive-strand viruses, no DNA stage; Flaviviridae;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              VITOLOGY 188:331-341(1992).

-!- FUNCTION: THE SMALL PROTEINS NSZA, NSZB, NS4A AND NS4B ARE HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.
NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
-!- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPMOFTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN MAND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MANA.
                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SEQUENCE FROM N.A.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRARE.FELSATED FUNCTION. NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION. SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: PROTEIN AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.

AAR73058-121 are potential peptide binders of HLA-A2.1 motif. Using motifs disclosed in the invention, these peptides were screened for further motifs. Only peptides with binding affinity of at least 1% (binding affinity is expressed as an ICSO value) as compared to the standard peptide (AAR71293) in assays. This peptide from hepatitis c virus has an binding value of 0.6100. The peptides of the invention can induce cytotoxic T lymphocytes which can react with target cells. They can be used for the treatment or prophlyaxis of cancer, eg.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A compsn. which induces a cytotoxic T lymphocyte (CTL) response to a hepatitis C virus (HCV) antigen (Ag) in a mammal comprises, a HCV CTL Ag response inducing peptide (i.e. AAR78941-R78955) and a lipid conjugated helper T cell inducing peptide. The compsn. is useful in the treatment and prevention of hepatitis C.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Compsn. inducing cytotoxic T lymphocyte response to pref. viral, bacterial, parasitic or tumour antigens - useful in the treatment and prevention of diseases associated with the antigen e.g. hepatitis B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 HCV core 178-187; cytotoxic T; CTL; epitope; helper T; HTL; cell; lymphocyte; antigens; treatment; disease prevention; hepatitis C; non-A; non-B.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ŏ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                AARS9496-R61666 are immunogenic 10mer peptides that contain a HLA-A2.1 binding motif. These peptides bind HLA-A2.1 and have a binding affinity of at least 1% as compared to a reference peptide (AAR71293). AAR61498 has an ICSO of 0.61 and the sequence occurs at position 178 in the HCV CORE protein. The peptides of the invention can induce cytotoxic T lymphocytes which can react with target cells. They can be used for the treamment or prophlyaxis of cancer, eg. prostate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 antigen; epitope; immunogenic target protein; PSA; HBVC; HBVS; EBV; HIVI; plasma specific antigen; hepatitis B virus; Epstein Barr; human immunodeficiency virus; human papilloma virus; pS3; c-ERB2; MAGE-1; melanoma antigen-1; core antigen; surface antigen; pharmaceutical composition; in vivo; ex vivo; therapeutic; diagnostic; MHC class I molecule; major histocompatability complex; HIA-A2.1; 9mer; 10mer; anchor; human leukocyte antigen; PLP; 8mer; andorithm prediction; MBP; CMV; cytomegalovirus; HSV; herpes simplex virus; influenza A; M1.
                                                                   Immunogenic peptide(s) having an HLA-A2.1 binding motif - used for treatment or prophylaxis of cancer, virus infection or autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  .

                                                                                                                                                                                                                                                                                                AAR84570-616, AAR84885-90 and AAR91054 are all HCV-1 derived peptides from the core, El, E2/NS1, NS2, NS3, NS4 or NS5 regions. The peptides were tested for peptide specific cytotoxic T-cell activity. The peptides AR84570-77 were found to have substantial homology with a T-cell epitope and are useful in vaccines against HCV infection.

Peptides AAW39430-W39734 are used in a novel method for the selection of immunogenic T-cell peptide epitopes present in polypeptide antigens. The method involves the identification of peptide sequences capable of binding to an HLA (human leukocyte antigen) class I molecule and measuring the binding of this epitope peptide to the HLA class I copetide. The stability of binding of the peptide and MHC (major histocompatability complex) class I molecule is measured on intact histocompatability complex) class I molecule is measured on intact human B cells carrying the MHC molecule at their cell surfaces. The method can be used to select peptide epitopes for generating vaccines against a disease associated with the polypeptide, e.g. cancers or AIDS. The peptide epitopes are especially T-cell peptide epitopes with strong anti-tumour and anti-viral immune responses. Peptides AAW39557-W39559 are conserved human papilloma virus type 16 (HPV16) E6 derived peptides used in an assay to determine immunogenicity and binding affinity to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                            Method of selecting T cell peptide epitope(s) - by measuring the stability of HLA class I-peptide complexes on intact B cells

                                                                                                                                                                                                                                                                                                                                                                                                                                                                 an immunological cytotoxic Tiymphnotyte (TL) response in a mammal. The method comprises: (a) delivering an antigen to the mammal at a level to induce an immunological CTL response in the mammal; and (b) maintaining the level of the antigen in the mammal's lymphatic system to maintain the level of the antigen in the mammal's lymphatic system to maintain the level of the antigen. The method can be used for the delivery of e.g. a differentiation antigen, a tumour-special multilineage antigen, a embryonic antigen, an embryonic antigen, an embryonic antigen, an embryonic antigen. They can be used for the treatment of disease such as cancer, e.g. mailgnant melanoma or infectious disease, e.g. viral disease such as hepatitis or AIDS. Sustained antigen delivery to the lymphatic system provides for potent CTL stimulation that takes that is necessary to keep CTL active, cyctooxic and recirculating through the body. AAX10071 to AAX10639 represent examples of peptide antigens given in the present invention.

The present invention describes a composition comprising a prepared hepatitis C virus (HCV) epitope such as those given in AA000010-AAJ04121. These are derived from HCV HLA-binding motifs. They are useful in vaccines for the prevention and treatment of HCV infection in humans. The
                                                                                                                                                                                                                                                        an immunological cytotoxic Tlymphocyte (CTL) response in a mammal. The method comprises: (a) delivering an antigen to the mammal at a level to induce an immunological CTL response in the mammal; and (b) maintaining the level of the antigen in the mammal slymphatic system to maintain the immunologic CTL response. The method can be used for the delivery of e.g. a differentiation antigen, a tumour-specific multilineage antigen, an embryonic antigen, an oncogene antigen, a mutated tumour-suppressor gene antigen, or a viral antigen. They can be used for the treatment of disease such as cancer, e.g. malignant melanoma or infectious disease, e.g. viral disease such as hepatitis or AIDS. Sustained antigen delivery to the lymphatic system provides for potent CTL stimulation that takes place in the militu of the lymphodic organ, and its ustains stimulation that is necessary to keep CTL active, cytotoxic and recirculating through the body. AAV10071 to AAV10639 represent examples of peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Hepatitis C virus; HCV; epitope; vaccine; immunogen; HLA-binding motif;
                                                                                                                                                                                                                              invention describes a method of inducing and/or sustaining
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
Inducing a cytotoxic T lymphocyte response - by maintaining a level of antigen in the lymphatic system of a mammal so as to provide a sustained CTL response, used to treat, e.g. AIDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A new composition useful as a vaccines against hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ;

These are derived from HCV HLA-binding motifis. They are useful in vaccines for the prevention and treatment of HCV infection in humans. The present sequence is an epitope used in the disclosure of the invention.
present sequence is an epitope used in the disclosure of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a composition comprising a prepared hepatitis C virus (HCV) epitope such as those given in AAJ00010-AAJ04121. These are derived from HCV HLA-binding mottlfs. They are useful in vaccines for the prevention and treatment of HCV infection in humans. The present sequence is an epitope used in the disclosure of the invention.
Hepatitis C virus; HCV; epitope; vaccine; immunogen; HLA-binding motif;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Hepatitis C virus; HCV; epitope; vaccine; immunogen; HLA-binding motif; antiviral.
